

Refactoring Challenge

Goal

Refactor the code to only do things once (DRY). Specifically, look at how to make the database calls once instead of multiple times in each user interface.

Bonus

Remove all references to data access (directly) from the user interface and reduce the data access code down to two methods that can be called in one line each, regardless of which SQL call is being made or what the data is coming in or going out.

"Practice makes the master."
